

Energy Efficiency in the Internet of Things: Ubiquitous Energy Awareness

Profs. Drs. José Roberto Amazonas (LCS/PTC/EPUSP)

The Internet of Things is a new network communications paradigm. The traditional Internet as we know it is a virtual world in which information is stored and can be accessed in computers around the world. The Internet of Things extends the Internet to objects of the physical, real world, providing capacity to interface and interact with them.

Projects architecture conceptual view

Culture

creative currency mediation: business model

An energy efficiency project should develop and validate a **holistic framework** of energy performance incorporating architectural metadata, environmental parameters, business critical models, treating the occupants as the central reference point. The project's framework, identifying and analyzing the **occupancy behavior** (presence and movement) should align the points of energy consumption to the correlated functional aspects (activities processes, assets, facilities state (light, gas, etc.)).

IDS - Information identifiers	SSPIDs - Service Support Personnel IDs	MIDs - Materials IDs
Prip - Providers IDs	AS _{IDs} - Asset IDs	L _{IDs} - Location IDs
U _{ID} - User IDs	UT _{IDs} - Utility IDs	EIDs - Event IDs (time stamps)
